GeneScan

Exporting to Korea

For over a decade, Eurofins GeneScan has offered the global agrifood industry the most advanced analytical tools for the detection of biotech crops. Our company continues to assist domestic and international markets with testing and certification solutions to aid in the commercial acceptance of food and feed products, including Asian markets such as Korea.

Korean food imports have been steadily increasing over the last couple of years with the amount of corn, soybeans and finished foods leading the way. With this surge in agricultural imports and with the Korean government strengthening the regulatory guidelines for the labeling of biotech products, the need for ensuring maximum compliance for labeling and the adventitious presence of biotech components takes on critical importance for product acceptance.

Our experienced staff can assist you with designing a testing plan for any of your products that are destined for Korea.

- Unsurpassed Portfolio of PCR Tests for All Commercialized Biotech Events in Corn, Soybeans, Rice, Canola, Potatoes, Tomato, Sugar Beet
- Quantitative PCR Tests to Determine Total % Amount of Biotech Events
